- In case a separate regulator is to be installed before burners then pressure at the farthest point (before the regulator) should not be less than minimum inlet pressure required at the regulator inlet .However it is to be ascertained that velocity in the system is not more than 20 m/s when all burners (existing as well as proposed) are running on full capacity.
- Pipe sizing and routing that is indicated in the quotation should be followed. In case of any changes in the pipe routing and burners shown in the indicative drawing, AGL engineer should be consulted.
- Globe valve (of Mild steel or Carbon steel) is required to be installed in IP line after the connectivity with outlet of MRS (in case of delivery pressure of 1.5 bar).
- In any specific site condition written approval must be taken by customer from AGL prior to work. MDPE pipeline, fittings certificates and isometric layout of proposed route must be submitted to AGL before commencement of work.

3.0 Construction:

• Meter Installation (Not applicable in case of Industries where MRS is Mandatory)

- Location of the meter should be as indicated by AGL. Generally, meter and regulator are fixed on the outer side of the property wall.
- Meter should be on right hand side with respect to crimp (P supply point).
- Horizontal distance between meter and crimp should be minimum.
- Height of the meter should make meter reading easy.
- Meter should be well supported on meter bracket.
- Meter inlet piece should be as per drawing supplied by AGL
- Caution / Safety Board or signage should be put near meter.

- Fitting to fitting joints are not acceptable.
- Pipe should not be routed through heated zone like bhattis / tandoor / furnace etc.
- Teflon tape should be used for threaded joints. M-seal or any other such sealant should not be used.
- for wall crossing the pipe should be protected with DENSOLEN –System S25HT/ R25HT. Pipeline should be thoroughly cleaned and should be free of moisture before applying primer. Pipeline should be dried for 30 min. and then inner coat (S25HT) and then outer coat (R25HT) should be wrapped. (Method of application as mentioned in product brochure should be followed).
- PVC sleeve to be provided wherever distance between pipe and electric cables/points is less than 1 ft.
- Flange/union/threaded joints should not be provided within 1 ft radial distance of electrical points.
- Flange/union joints should be provided only to avoid position welding.
- For more than 3/4 " branch branching tee should be provided.
- All pipe work should be horizontally and vertically aligned.

4.0 Testing:

- Entire pipe work should be flushed with nitrogen to remove dust, dirt, welding spatter etc. Meter and regulator should be removed before flushing. Flushing should be done from each point.
- Once flushing is completed entire pipework should be tested (Pneumatic Test) at 6 Bar(g) pressure after removing meter for 24 Hrs. Testing should be done with all appliances valves open and plugged.

SBU: Industrial Packaging

Pressure should not drop during testing. Each joint specifically threaded joints should be checked with leak detection fluid.

- Once testing with 6 Bar(g) pressure is found OK, pressure should be vented out, meter and regulators (if reqd) to be fixed in place and again entire pipework along with meter should be tested at 150 mbar(g) pressure for 2 hours. Meter inlet and outlet joints to be checked with leak detection fluid.
- Once testing is OK a testing certificate should be prepared
- After completing testing entire pipework should be under pressure of 150 mbar (g).

5.0 Painting:

— Burners should be used as received from the suppliers. Jet plate and jet sizes should not be changed at the time of fixing.

— Where-ever possible use pilot operated burners and pilot should be “ON” at all the time.

— Copper pigtail of maximum possible size should be used to connect burner to manifold valve. Copper pigtail should bend without any sharp pinch.

- If Class-I local supplier matches L1 price the contract will be awarded to them.
